CLIMATE ADAPTATION STRATEGY

Project Title: Digital Coast: Putting data, information and options in the hands of natural resource managers

Headline Title (2-5 words):

Brief Summary (Abstract): The Digital Coast website was created to provide tools, trainings, stories from the field, and information that allow users to incorporate updated climate data into coastal management decisions. Digital Coast houses a number of tools that can facilitate the management of our nation's national resources in a changing climate. One way NOAA delivers data to help managers plan for is through a Sea Level Rise and Coastal Flooding Impacts Viewer. The power of this tool is that inundation zones can be visualized on top of other community data, such as critical habitat, so that managers can see what is at risk. Another tool for resource managers is the Habitat Priority Planner, which can help to identify priority locations for conservation, restoration, and provide information for adaptation planning. A popular training provided via Digital Coasts partners includes "Introducing Green Infrastructure for Coastal Resilience", which covers green infrastructure concepts and practices that can play a critical role in making coastal communities more resilient to natural hazards.

Project Location: National

Partners: American Planning Association, Association of State Floodplain Managers, Coastal States Organization, National Association of Counties, National States Geographic Information Council, The Nature Conservancy, Urban Land Institute, National Estuarine Research Reserve Association and the National Oceanic and Atmospheric Administration.

Background:

Project Goals: To provide tools, trainings, stories from the field, and information that allow users to incorporate updated climate data into coastal management decisions.

Strategy Goals Implemented: 3, 4

Climate Impacts Addressed:

Status of Project Implementation (Timeline, Milestones, Next Steps):

Project Outcomes:

Example Submission

Project Title: “Assessing the vulnerability of species and ecosystems to projected future climate change in the Pacific Northwest”

Headline Title (2-5 words): Pacific Northwest Vulnerability Assessment

Brief Summary (Abstract): A collaborative project to assess the vulnerability of species and ecosystems to future climate change impacts in the Pacific Northwest.

Project Location: Washington, Idaho

Partners: This project is a collaboration among researchers, managers, and planners at the [University of Washington](#), [U.S. Geological Survey](#), [The Nature Conservancy](#), the [National Parks Service](#), the [U.S. Forest Service](#), the [Washington Department of Fish and Wildlife](#), the [University of Idaho](#), the [National Wildlife Federation](#), the [Oregon Department of Fish and Wildlife](#), and [Idaho Fish and Game](#).

Background: In the Pacific Northwest temperatures have increased by about 0.8 °C and models project warming of 1.8°C by the 2040s and 3.0°C by the 2080s . Precipitation is also projected to change, with general increases projected for the Pacific Northwest, and with a more intense seasonal precipitation cycle - autumns and winters may in fact become wetter and summers may become drier. Further, regional climate models indicate that extreme precipitation in western WA will increase and the snowpack in the Cascades will decrease. Although the trend in direction of change is broadly recognized, there is uncertainty associated with what actual extent of changes may occur through time and in local areas.

Project Goals: The goals of this project are to incorporate climate change information into management planning and implementation efforts by providing: (1) downscaled regional climate models (~1km), (2) simulated shifts in vegetation, (3) an extensive database of documented species vulnerabilities, (4) models of species range shifts for selected species, (5) summaries of the extent of uncertainty in the climate, vegetation, and species changes, and lastly (6) a collaboration of resource managers working to incorporate climate change information into management planning and implementation efforts.

Strategy Goals Implemented: Goal 2, Strategy 2.2, Action 2.2.1 Use vulnerability assessments to design and implement management actions at species to ecosystem scales.

Goal 2, Strategy 2.1, Action 2.1.3 Identify species and habitats particularly vulnerable to transition under climate change

Climate Impacts Addressed: Impacts on species and habitats

Status of Project Implementation: Project is ongoing. Currently, over 570 species are in the database and nearly 200 are complete.

CLIMATE ADAPTATION STRATEGY

Project Outcomes: The Pacific Northwest vulnerability assessment includes two distinct components; first, a database that highlights and details the sensitivity of species and habitat in the study region. The estimated sensitivity of individual species will be based on the ability of the species to disperse and whether dispersal barriers exist, dependency on disturbance regimes (e.g. fire or flood), physiology (e.g., temperature, salinity), dependency on climatically-sensitive habitat requirements (e.g., alpine areas, shallow wetlands), whether the species is a generalist or specialist, and whether the species existence is tied to other specific species. The second component of the assessment involves modeling the potential effects of climate change on species and habitats. This includes: 1) downscaling the climate change projections, 2) simulating potential changes in vegetation, and 3) modeling potential effects on the distribution of 12 focal wildlife species using a hierarchical approach.
